

ALTCOIN SELECTOR

PREMIUM INTELLIGENCE TERMINAL — OPERATING MANUAL

1. EXECUTIVE SUMMARY & CORE PHILOSOPHY

The **Altcoin Selector** is a quantitative cryptocurrency scanning terminal designed to detect extreme volatility contraction patterns, colloquially known as "coiled springs." Traditional market market-scanners often generate erratic alerts based on reactive price momentum, causing retail traders to chase vertical expansions ("pumps") at ill-advised locations.

In contrast, this intelligence terminal utilizes asset compression mechanics built around **Bollinger Band Squeeze theory** and **Relative Strength Index (RSI)** confluence. By prioritizing phases of extreme equilibrium, the terminal isolates high-tension consolidation structures before explosive directional expansions occur.

2. CONTROL PANEL & FUNCTIONAL CONFIGURATIONS

The terminal's orchestration panel dictates how the asynchronous data gathering pipeline filters assets:

- **Timeframe Filter:** Calibrates the candle interval fetched from the OKX Spot API (**15m, 1H, 4H, 1D**).
- **Scope Slider:** Dynamically restricts the asset universe by market capitalization.
- **Auto Scan Engine:** A non-blocking automation routine scheduling sequential pipeline execution every 15 minutes.
- **Telegram Alerts Engine:** A background notification vector routing elite signals to your mobile device.

3. MARKET SCREENER ALGORITHM & VOLATILITY SCALE

The underlying mathematical core relies on standard Bollinger Band derivations over a baseline window (**N = 20**).

$$Bandwidth\ (\%) = [(Upper\ Band - Lower\ Band) / SMA] \times 100$$

Dynamic Volatility Co-efficiency

To mitigate false-positive filters across different horizons, the engine enforces a **Dynamic Volatility Threshold Scale**:

Timeframe	Squeeze Limit (Max Compression)	High Volatility Threshold
15m	$Bandwidth < 3.0\%$	$Bandwidth > 8.0\%$

1H	<i>Bandwidth < 5.0%</i>	<i>Bandwidth > 12.0%</i>
4H	<i>Bandwidth < 8.0%</i>	<i>Bandwidth > 18.0%</i>
1D	<i>Bandwidth < 12.0%</i>	<i>Bandwidth > 30.0%</i>

Signal Extraction Mechanics

- **Squeezing:** Bandwidth drops beneath the timeframe limit; direction is neutral.
- **Bullish Breakout:** Extreme compression confirmed with *RSI > 60*.
- **Bearish Breakout:** Extreme compression confirmed with *RSI < 40*.

4. RECOMMENDATION ENGINE (WATERFALL ARCHITECTURE)

TIER 1: HOLY GRAIL (3-TIMEFRAME CONFLUENCE)

Requires active breakout triggers matching massive institutional volume expansion (*Tier 2* validation), along with structural macro and micro price alignment (Price vs. SMA100 & SMA4).

TIER 2: SHARK VOLUME (SMART MONEY TRACKER)

Triggered when an active breakout occurs on volume that eclipses *2.5×* the 20-period volume moving average.

TIER 3: TREND ALIGNED (PROBABILISTIC CO-EFFICIENCY)

Ensures structural breakout triggers align completely with the overarching structural trend (*Price vs SMA100*).

5. TELEGRAM INTEGRATION & ALERT CONFIGURATION

Follow these steps to establish a secure webhook:

1. Create a bot via *@BotFather* on Telegram and copy the **HTTP API Token**.
2. Message *@userinfobot* to retrieve your personal **Chat ID**.
3. In the terminal, click **ALERTS**, paste the credentials, select your preferred Tiers, and click Save. (*Send a "Hello" message to your bot to initialize the channel*).

6. EXECUTION WORKFLOW

1. **Step 1: Alignment** Calibrate timeframe filters and execute a localized market scan.
2. **Step 2: Review** Inspect the primary recommendation grid for Tier 1 & 2 setups.
3. **Step 3: Verification** Open the live asset chart to verify the boundaries of the compression phase.
4. **Step 4: Trigger** Place entries **ONLY** upon a structural candle close breaking outside the Bollinger Band barrier.
5. **Step 5: Protection** Enforce hard stop-losses immediately upon execution at the opposite band boundary.

7. TECHNICAL SPECIFICATIONS & WARRANTY

Core: CustomTkinter, Pandas, NumPy, aiohttp (Asynchronous I/O).

Provider: OKX REST API v5.

Warranty: Supplied strictly on an "AS IS" operational basis. Premium license holders are entitled to lifetime patches via the distribution platform.

8. TROUBLESHOOTING & FAQ

Q: Why does the terminal display "ERROR: DATA RETRIEVAL FAILED"?

This indicates a network timeout or connection block to the OKX API. Ensure your network allows API requests, or use a VPN if your regional ISP restricts cryptocurrency exchange traffic.

Q: Auto Scan is activated, but I am not receiving Telegram alerts?

Ensure the application is open and the PC is not in sleep mode. Verify your Bot Token and Chat ID, check if your Tier filters are ticked, and confirm you have initiated the chat with your bot by sending a direct message first.

Q: Why is Windows Defender / Antivirus flagging the application?

This is a standard "False Positive" for independent compiled executable (.exe) files that lack an expensive Enterprise Digital Certificate. You can safely select "More info" > "Run anyway" or add the software folder to your antivirus exclusions.

Q: The Market Screener shows almost all assets as "High Volatility"?

This occurs naturally during major macroeconomic news events (e.g., CPI releases, FOMC meetings) or sudden Bitcoin liquidations. The entire market is experiencing macro-expansion, meaning the 'Squeeze' phase has already passed. Wait for the market to consolidate.

9. STRICT FINANCIAL DISCLAIMER (RISK WARNING)

CRITICAL FINANCIAL RISK NOTICE — NOT FINANCIAL ADVICE

The Altcoin Selector is an automated mathematical data filtering terminal. It processes pure mathematical algorithmic variables and historical chart patterns. **The terminal does not provide personalized investment advice, financial planning, or trading recommendations.**

Cryptocurrency trading carries immense systemic risk. The developer accepts **ZERO responsibility or legal liability** for any financial losses or capital drawdowns incurred directly or indirectly through the execution triggers generated by this application. Users execute market orders entirely at their own risk.
